## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(c), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(c) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 03/31/2009 has been entered.

### ***Response to Arguments***

Applicant's arguments with respect to claims 1, 3, 8-9, 12-15 and 17-19 have been considered but are moot in view of the new ground(s) of rejection.

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1, 3, 8, 9, 12-15, 17, 19, 49 and 50 are rejected under 35 U.S.C. 102(e) as being anticipated by Browning (US 6,960,160). Browning discloses a system (fig. 1) fully capable of minimally invasive breast lifting (the same claimed structure is capable of the same method of use), comprising:

one or more anchors adapted to be are fixed to a posture tissue (30), above a desired nipple level (also capable of this),

with two or more readily adjustable suspension members (20) suspended from the one or more anchors (30) each readily adjustable suspension member having a free end (at 10); and

a cradling portion (10) having a first end and a second end and being configured to and fully capable of cradling the breast from below, said the first end and the second end of the cradling portion being integral (fig. 3, one unit, the bottom of the fig.) with and/or movably attached (fig. 3, the bottom of the fig.) to the free end of a respective suspension members, and having a width greater than the width of each of the two or more readily adjustable suspension members (as seen in fig. 3).

Regarding claim 8, 30 is hook shaped and capable of clinging from a rib.

Regarding claims 13 and 14, as done in the reference.

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 18 is rejected under 35 U.S.C. 103(a) as being unpatentable over Browning (US 6,960,160). Browning discloses a system as discussed above. However, Browning remains silent as to both free ends of the suspension member are attached to a single anchor. It is well known in the art of organ suspenders to tie or suture together the ends of the suspender around a bone as for the purpose of anchoring the suspender. It would have been obvious to one of ordinary skill in the art at the time the invention was made to substitute joining the together the ends of the

suspender around a bone for the anchor member(s) in order to anchoring the suspender. Such a modification is a functional equivalent substitution in the art of organ suspender.
